March 24th: NY Outage Begins

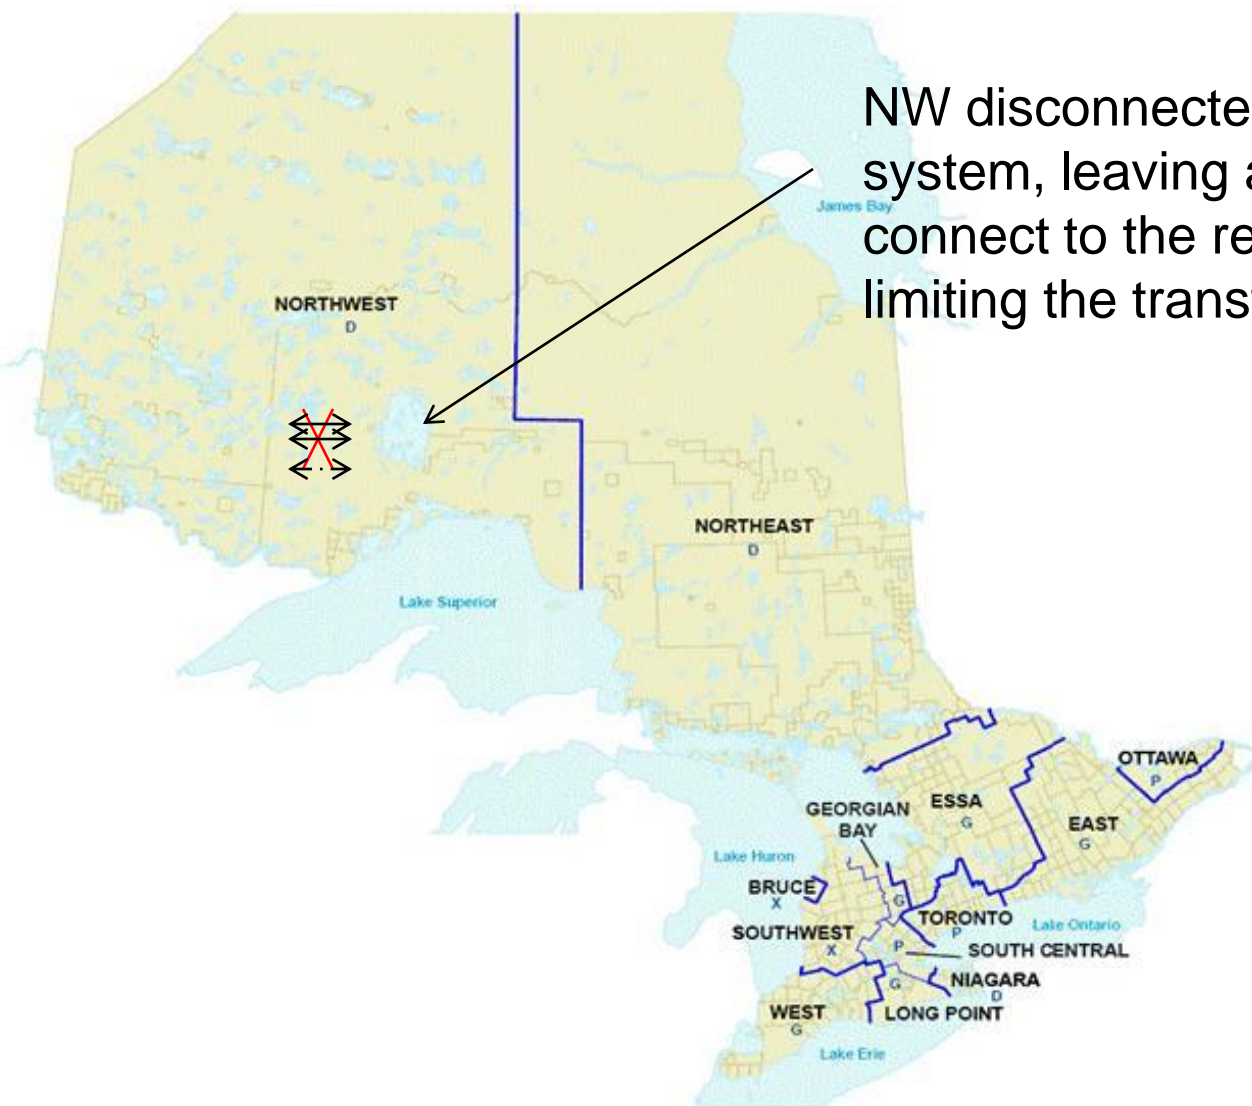

ieso

Power to Ontario.
On Demand.

March 25th: Northwest is Disconnected

NW disconnected via the 230kV system, leaving a single 115kV line to connect to the rest of Ontario – limiting the transfer to close to zero

March 29: Line Loss Limiting Flow North/South

Lose an XxE Line (500kV), limiting flow North/South

- Losing a second XxE will mean all generation moving North will be on two smaller circuits (115kV in the North and a 230kV line in the South)
- Scheduling limit was reduced in both directions
- Increase generation in the North to supply load and decrease generation in the South to compensate for the increase in the North
- Based on the offers in the market, the decrease in generation was nuclear generation
