

Counter-Intuitive Failure Charges

Intertie Jurisdictional Trading
June 3, 2008

- Looked at extreme pricing events over the past two years
 - Did not find occasions where a failure charge has been unreasonably applied
- Price-based criteria (price difference between pre-dispatch and real-time greater than a specific value) for reviewing failure charges will not be considered by MACD

- Looking to consider the following events which would result in a review of the appropriateness of the failure charge by MACD:
 - Export failure charges when the IESO is curtailing for adequacy or security (same hour, same interface)
 - A loss of a generator and real-time price decreasing
 - A generation gain and real-time price increasing
- The result may be a rule change or a manual change in order to permit a review
